The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7137) ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The specification describes a method for directing integration of a nucleic acid of interest to a pre-determined site, where the nucleic acid of nucleic acid of interest to a pre-determined site, in a cutaryote with a preference for non-homologous recombination. The method comprises comprises an integration pathway towards homologous recombination. The preference for non-homologous recombination. The method is useful for directing integration of a nucleic acid of interest to a subtelomeric and/or telomeric region in an eukaryote with a preference for non-homologous recombination. The nucleic acid of interest comprises an inactive gene to replace an active gene, or view eversa, is a portion of a gene delivery vehicle, confers a desired property to the cukaryotic cell, or encodes a therapeutic proteinaceous substance or a substance conferring resistence for an antibiotic substance or a cell.

The method is useful for improving gene targeting efficiency. The method is useful in the replacement of an active gene by an inactive gene, for e.g. for the inactivation of genes controlling undesired side branches of metabolic pathways, to increase the quality of bulk products such as starch, or to increase the production of specific secondary metabolites controlling senescence in fruits and flowers or that determine flower pigments. The method is also useful for replacing an inactive gene for engineer the replacement of a defective p33 by an intact p53. Many tumours acquire and often correlates with a poor cintact p53. Many tumours acquire and often correlates with a poor tract p53. Many tumours acquire and effect p53 by an intact p53. Many tumours acquire and effect p53 by an intact p54. Changes of succeeding. The method is also useful for therapy have better changes of succeeding. The method is also useful for therapy have better changes of succeeding. The method is also useful for therapy and the context therapy, conventional anticidada genes of succeeding. The method is also useful for therapeut of the apredetermined 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           46
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Directing integration of nucleic acid of interest to a sub-telomeric region in an eukaryote with preference for non-homologous recombination, by steering an integration pathway towards homologous recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -----IPWKTFDETIKE

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical furgs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-

                                                                                                                                                                                                                                        New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinecobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii present sequence represents the amino acid sequence of an A. baumannii protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                           The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, pseudomonas actuginosa and Enterococcus facedils. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain proteins capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                   ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences qiven in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   78 EATQTV-YEWCGVVTQLLSAYILLFDEYNEKK-ASAQKDILIRILD---DGVNKLNEAQK 132
                                                                                                                                                                                                                                                                                                                                                                                                                                      Reducing or reversing tolerance, physical dependence, hyperalgesia, withdrawal symptoms, or pain sensitization in patients on analgesics for chronic pain, comprises inhibition of the extracellular signal-regulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of reducing or reversing tolerance, reducing the risk of physical dependence or hyperalgesia, reducing the symptoms of opioid withdrawal or inhibiting pain sensitiation in a patient taking analgesics. The method comprises administering an analgesic and an extracellular signal-regulated kinase (ERK) inhibitor comprised in a formulation to reduce or reverse tolerance, risk of physical dependence, hyperalgesia, symptoms of opioid withdrawal, or inhibiting pain sensitisation in patients taking analgesics for chronic pain or those undergoing surgery. The present sequence represents the amino acid sequence of human MEKI (not defined)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  133 SLLGSS----QSFNN--ASGKLLALDSQLTNDFS---EKSSY-FQSQVDRIRKEAYAGAA

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (81), given in the specification. The proteins have antibacterial and antinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and the specification. The proteins have antibacterial and antinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a bindingical sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be seed encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotide for treating Chlamydia infections encodes a polynucleotides containing an immunogenic portion of a Chlamydia antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           41 DETIKELSRFKQEYSQEASVLVGDIKVLLMDSQD--KYFEATQTVYEWCGVVTQLLSAXI 98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide encoding at least a partial Chlamydia protein which is an antigenic fragment, or the complements, fragments, homologues and variants, and antibodies raised against the antigenic proteins (or fragments). The nucleic acids, proteins and antibodies are used to diagnose and treat Chlamydia infections (e.g. a sexually transmitted disease, pelvic inflammatory disease (PID), acute respiratory tract infection, trachoma, atherosclerosis and coronary heart disease) in a patient, and in the treatment of male infertility. The compounds of the invention are also useful for detecting the presence of Chlamydia in a patient, and stimulating and/or expanding T cells specific for a Chlamydia protein. The present sequence represents a Chlamydia antigen. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   155 EEVNNIKKALEAQKDTIDKLNKLVTLQNQNKSLTEVLKTTDSADQIPAINSQLEINKNSA

The present invention describes compounds and methods for diagnosing and treating Chlamydial infection. Chlamydia polynucleotide and protein sequences have antibiotic, antiinflammatory, antiinfertility, cardiant, antiarteriosclerotic and ophthalmological activities, and can be used in vaccines, and in gene therapy. The Chlamydia polynucleotides, proteins, compositions or methods from the present invention can be used for the serodiagnosis or treatment of Chlamydial infections, particularly in humans. The polynucleotides, proteins or compositions are particularly useful for stimulating an immune response in a patient, or for stimulating an immune response in a patient, or for stimulating an immune response in compositions are useful as specifically, the polynucleotides, proteins or compositions are useful as vaccines for treating or preventing Chlamydial infections including

19-JUN-2003 (first entry)

The invention relates to an isolated mucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the mucleic acid concluded are: (2) a host cell containing the vector; (3) an isolated concluded are polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for conjuded for proliferation, or that inhibits cellular proliferation; (8) identifying a gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent or compound's activity; (11) a culture computaing strains in which the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying proteins or screening for homologue nucleic acids are useful for confideration or solve an organism. The antisense nucleic acids are useful for for cellular proliferation to solate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences isolate candidate molecules for rational drug discovery programs Claim 25; SEQ ID NO 58016; 1766pp; English

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concluded are:

(2) a vector comprising a promoter operably linked to the nucleic acid concluded whose expression is inhibited by the antisense concluded or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding compoundation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for that has an activity against a biological pathway or equired for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product in the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism activity; (11) a culture comprising strains in which the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of strains; or (13) identifying the target compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is encoded by one of

derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
```

```
that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that moulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at (tp. wipo.int/pub/published_pot_sequences).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1338 --IRQLEEEKNSLOEQQEE---EEEARKONLEKQVLALOSQLADT-----KKKVDD-- 1382

Novel bone marrow polypeptide #2.

severe combined immunodeficiency; SCID

WO200157187-A2.

Homo sapiens

Costigan M;

Befort K,

```
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                             frp.wipo.int/pub/published_pct_sequences.

AAU14602-AAU14794 represent novel bone marrow polypeptides of the invention. The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with the proteins and treatment of diseases associated with decreased expression. For example, to treat disorders associated with decreased expression by rectifying mutations or disorders associated with decreased expression by rectifying mutations or polypeptides by expressing inactive proteins or to supplement the colypeptides by expressing inactive proteins or to supplement the conjugation of the polypeptide. Additionally, the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acid and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients can seasys to identify medulators of their expression and activity. The antiposes in the protein antibodies against bone marrow proteins and confined samples and antiposes in the protein antibodies and antagonists may also be used to down regulate expression and activity. The antipodies may also be used as the antipose and antipodies and antagonists may also be used to can assays to identify medulators of their expression and activity. The artichodies may also be used to the activity and consequently in the presence of the protein in samples of e.g. by enzyme linked immunoschant assay (ELISA)). The proteins may be used to regulate haematopoiesis activity, and consequently in the cused to require hammatopoiesis activity, and consequently in the cused to require hammatopoiesis activity, and consequently in the protein as wound healing, as a nutritional supplement; and in treatment of immune disorders such as severe combined immunodeficiency (SCID)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1424 DIEKAILEQOVLSEELTTKKEQVSEAIKTSQIFLAKHG-HKLSEKEKKQI--SEQLNALN 1480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                               The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, or human polynuclectides or a polynuclectide which represents a fragment, contains a vector comprising the movel polynuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that increases or decreases the expression of the polynuclectide sequence subjected to pain, a method for identifying a compound which regulates the expression of a polynuclectide sequence which is differentially a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the composition, a method for identifying a compound useful that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating the pain and a method for identifying a compound useful in treating a pain and a method for identifying a compound useful in treating a pain and a method for identifying a compound useful in treating an animal of one or more of the polypeptides given in the pain and a method for identifying a compound useful in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pain and a pharmaceutical composition comprising the one or more poin and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (chung), chronic constriction injury (CCI) and spared nerve injury (chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAU14603 standard; protein; 5373

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with a letter discondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                         248

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in

vaccination. The nucleic acids (I) may be used to produce the S.
epidermidis polypeptides (II) via the production of vectors containing
them which are used to produce hosts cells which express the
collapseptides. The polypeptides (II) (and/or nucleic acids) may then be
used to vaccinate subjects and to raise antibodies against the bacteria.
The polypeptides may also be used to assay for other inhibitors of their
activity and herefore identify compounds that may be used for the
treatment of S. epidermidis infections, eg. endocarditis. AAH53971 to
AAH55090 represent specifically claimed S. epidermidis genomic DNA
copressor specifically claimed S. epidermidis genomic DNA
cepresent oligonucleotide sequences and primers which are used in the
exemplification of the present invention. N.B. The present invention
specifically claims all the polymucleotide sequences given in the
cequence listing of the present specification, however the sequence
listing only goes up to SEQ ID NO:4454 so even though sequences are given
in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62 AQINQLLQXY------KGKRQQN-----DYDIEKLN---YELVKATENYEQLSGK 102

The present invention describes a meturo (MI) tot the staget abserming to contacture using peptide nucleic acids (PMAs). MI comprises: (a) contacting a nanostructure intermediate (NSI) having at least one unbound contacting a nanostructure intermediate (NSI) having at least one unbound different JE where: (i) none of these JE can interact with itself or content JE where: (i) none of these JE can interact with itself or content JE where: (i) none of these JE can interact with itself or complementary, so that AU becomes non-covalently linked to NSI to produce a new NSI for us in subsequent cycles; (b) removing unbound AU; and (c) cyclic repetition of (a) and (b) to form a nanostructure. The new feature CG is that the complementary JE in at least one cycle are PNAs. Also described are nanostructures formed from many AU, comprising different JE, where at least one AU includes PNA. MI is useful for producing nanostructural reinforcements (for aeroge), paper; plastics or cement.

CG nanostructural reinforcements (for aeroge), paper; plastics or cement, particularly as long fibres to improve tensile strength); identification (anti-counterfeiting) markers; enzyme or catalyst supports; assembly caffor construction of nanowires on anostructures for construction and elivering specific molecules; in high-counter menories; as artificial zeolite for absorbing ions from water and for construction of new materials, including use in biosensors.

CG by a se more homogeneous than inorganic nanoparticiles generally used to construction of new materials, including use in biosensors.

CG by a ser more homogeneous than inorganic nanoparticiles generally used to construction of new materials, including use in biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           form nanostructures, so will produce structures with predictable geometry and stoichiometry. The present sequence represents a protein containing colled coil dimerisation sequences that can be used for structural elements of assembly units, given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method (M1) for the staged assembly of
                                                                                                                                                                                                                                         Staged assembly of nanostructures, useful e.g. in biosensors or as catalyst supports, using assembly units derived from peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 58; 118pp; English

unbound joining element with an assembly unit comprising different unbound joining elements (b) removing unbound assembly units; and (c) repeating steps (a)-(b) for a sufficient number of sycles to form a nanostructure, where the assembly unit in at least one cycle comprises a peptide nucleic acid. A single joining element of the different joining element and a cide. A single joining element of the different joining element and a cide unbound joining element of the different joining element of the manostructure intermediate are complementary joining element of complementary joining element of complementary joining element of complementary joining element of complementary joining elements of complementary joining elements of a nanostructure further comprises: (i) capping the nanostructure with at least one capping unit; and (ii) post-assembly conversion of specific concovalent interactions of complementary joining element to covalent concovalent interactions of complementary joining element covalent comprises a surface bound initiator assembly unit used in at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises at least one cycle comprises and least one cycle comprises at least one cycle comprises and least one cycle comprises and least one cycle cycle cycle cycle cycle 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Staged assembly of a nanostructure containing peptide nucleic acid assembly units comprises contacting a nanostructure intermediate with an assembly unit comprising different joining elements, and removing unbound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          539 EEVKKTLEQHDSIVTHYKNMIREQDLQLEELKQQISTLKCQNEQLQTAVTQQVSQIQQHK 698
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           52 QEYSQEASVLVGDIKVLL-MDSQDK--YFEATQTVYEWCGVVTQLLSAYILLFDEYNEKK 108
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to staged assembly of a nanostructure comprising: (a) contacting a nanostructure intermediate comprising at least one unbound joining element with an assembly unit comprising different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11 EVVKSAIETADGALDFYNKYL------DQVIPWKTFDE-----TIKELSRFK

osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritis, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease,

             detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

the 613 antisense sequences given in the specification where expression of the aucleic acid inhibits proliferation of a cell. Also included are:

(1) a westor comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of against a biological pathway consideration or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the proliferation or the decrease of a gene on which the test compound that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene or which each of the strains an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains of strains in which each of the strains or screening for homologous nucleic acids are useful for proliferation to isolate candidate molecules for rational dentifying proteins or screening for homologous nucleic acids are useful for the target prokaryotic essential genes. Note: The sequence data for this patent did not format directly from INPO aureus, S. typhimurium, K. pneumonias or P. aeruginosa. The present sequence is encoded by one of patent did not format directly from MIPO accellulation, but was obtained in electronic format directly from MIPO accellulation of the proper sequences.
                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -----TLSEFAGT----SAYI---EEYADIIRSKSILRKMIQAAKDIEKKAAEEP 139

The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate bone marrow polypeptide expression. For example, to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of the polypeptides by expressing inactive proteins or to supplement the patient's own production of the polypeptide. Additionally, the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of

may be in need of restorative therapy. The proteins may also be used as antigens in the production of antibodies against bone marrow proteins and in assays to identify modulators of their expression and activity. The anti-bone marrow protein antibodies and antagonists may also be used to diagnostic agents for detecting the presence of the protein in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The proteins may be used to regulate haematopoiesis activity, and consequently in the succeeding the presence of the proteins may be used to regulate haematopoiesis activity, and consequently in the succeeding of my antibodies in thissue regeneration, such as wound healing, as a untritional supplement; and in treatment of immuno disorders such as severe combined immunodeficiency (SCID)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     89 VVTQLLSAYILLFDEYNEKK----ASAQKDILIRILDDGVNKLNEAQKSLLGSSQSFN--- 142

```

The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately- useful proteins. The present sequence is Neisseria meningitidis (serogroup B, strain 2996) 961c-741 fusion protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAUZ7553-AAUZ7610 represent Neisserial proteins and peptide regions of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                    expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is Neisseria maningitials (serogroup B, strain 2996) 961cL-741 fusion protein. (Updated on 11-SEP-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAU27553-AAU27610 represent Neisserial proteins and peptide regions of proteins of the invention

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deeps sea hydrochermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ϊ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KLIPELNDRLKAVQNFFTSLSVTVKQANKDIDAAKLKLATEIAAIGEIKTETETTRFYVD 265
